

Use Case 1: Financial Services (Insurance)

Project Title: The Proactive Safety Agent

A next-generation AI agent designed to transform insurance from a reactive claims processor into a proactive partner in customer safety.

The Business Problem

- **The Pain Point:** Our loss ratios are unnecessarily high due to preventable, high-cost accidents. A significant portion of major claims stems from vehicle equipment failures for which recalls were issued but never acted upon by the policyholder. This reactive model damages profitability and misses a key opportunity to build customer trust.
- **The C-Suite Objective:** We need to reduce our automotive loss ratio by 5-10% and decrease customer churn by demonstrating tangible, everyday value beyond just processing claims.

The AI Agent Solution

- **High-Level Agent Architecture:** The Proactive Safety Agent is an automated system that constantly monitors vehicle safety information and cross-references it with our policyholder data to deliver personalized, life-saving alerts.
- **Data Sources** (find or generate):
 - [NHTSA.gov/recalls](https://www.nhtsa.gov/recalls)
 - Policy data
 - Safety manuals
 - Claims data
 - Service records data (from vehicle service companies)
- **Considerations:**
 - **Ingestion & Monitoring:** Continuously scans public and private vehicle recall databases, such as [NHTSA.gov](https://www.nhtsa.gov) (hint: there is an [API](#)), for new safety issues.
 - **Identification:** Parses our internal **policy data** to instantly identify every policyholder and specific Vehicle Identification Number (VIN) affected by a new recall.
 - **Triage & Prioritization:** Analyzes the recall notice and data from **safety manuals** to categorize its severity (e.g., "Critical," "Urgent," "Standard").
 - **Personalized Outreach:** Orchestrates a multi-channel outreach campaign, contacting the affected policyholder via their preferred method (SMS, In-App Notification, or Email) with clear, simple instructions.
 - **Verification & Follow-up:** Monitors **claims data** and **service records data** (A2A with service company) to confirm the recall repair has been completed. If no

action is taken within a set timeframe, it triggers automated, encouraging follow-ups.
